

## Technology Fact Sheet for Mitigation

### C. The PHEV technology <sup>i</sup>

1. Introduction	
1.1. Historical	<ul style="list-style-type: none"><li>- The concept of PHEV option is well known in transport sector but its diffusion and deployment have not been characterized by a high speed of penetration in the market</li></ul>
1.2. Location of Resources	<ul style="list-style-type: none"><li>- Recharging batteries requires a set of stations providing electric energy preferably generated through use of renewable resources</li></ul>
1.3. Variability of Resources	<ul style="list-style-type: none"><li>- Renewable energy sources of electric power expected can be mainly the solar based options, geothermal and hydropower ;</li><li>- Such sources are stable in Rwanda</li></ul>
2. Brief Description	
2.1. Conditions	<ul style="list-style-type: none"><li>- Large campaigns</li><li>- Installation of appropriate stations for recharging the batteries running the electric motors of vehicles</li></ul>
2.2. Characteristics	<ul style="list-style-type: none"><li>- Any PHEV is mainly equipped with a combination of a classic efficient gasoline engine, a conventional electric motor and rechargeable batteries</li><li>- Recharging batteries through a station connected to electric grid</li><li>- Efficiency of internal combustion is 25% in urban areas</li><li>- Efficiency of battery electric motor to wheels a conversion of chemical energy into rotation energy is about</li></ul>

	75%
<b>3. Applicability and Potentialities in Rwanda</b>	
3.1. Applicability	<ul style="list-style-type: none"> <li>- PHEV can largely work in Rwanda as far as power projects for electric generation through renewable option are part priority at short and medium terms</li> <li>- PHEV technology and its components are commercially proven and can be applied in Rwanda road transport market</li> <li>- PHEV is a potentially promising technology for mitigation purposes</li> </ul>
3.2. Potentialities	<ul style="list-style-type: none"> <li>- Opportunities and potentialities for PHEV technology are important especially within the current context of regular increase in the costs of importation of vehicles and gasoline and diesel fuels</li> </ul>
3.3. Limitations	<ul style="list-style-type: none"> <li>- Rechargeable batteries require a special maintenance and recharges with a relatively high frequency of returning to the station</li> <li>- A lot of second hand vehicles are available on the local market</li> </ul>
<b>4. Status of the Technology in Rwanda</b>	
4.1. Local Production	<ul style="list-style-type: none"> <li>- Not yet introduced in Rwanda</li> <li>- Both batteries, electric motors, internal combustion engines and other spare-parts are imported</li> </ul>
4.2. Shared Power Plants	<ul style="list-style-type: none"> <li>- NA</li> </ul>
4.3. Projects	<ul style="list-style-type: none"> <li>- PHEV option is still a project idea in Rwanda</li> </ul>

	<ul style="list-style-type: none"> <li>- Goals and visionary aims for efficient inclusive integrated transport system</li> <li>- fully secure domestic energy supply, multi-modal transport based efficient technologies) are projected up to 2050</li> </ul>
<b>5. Benefits to Development</b>	
5.1. Social	<ul style="list-style-type: none"> <li>- Introduction to the new vehicles on local market can induce an interest in setting up local units for manufacturing components of PHEV and hence for creating new jobs</li> </ul>
5.2. Economic	<ul style="list-style-type: none"> <li>- Benefits from increasing use of renewable resources and decreasing importation of gasoline and diesel for vehicles</li> <li>- Potential manufactures and industry of PHEV components</li> <li>- Cost of electricity is lower than the cost of fossil petroleum fuels</li> </ul>
5.3. Environmental	<ul style="list-style-type: none"> <li>- Using such vehicles based on a mixed «electric and liquid fuel» contribute in a significant decrease in GHG emissions</li> </ul>
<b>6. Climate Change Mitigation Benefits</b>	
6.1. Reduction GHG Emissions	<ul style="list-style-type: none"> <li>- The amount of CO<sub>2</sub> emissions is about 0.11 kg/km for PHEV against about 0.44 kg/km by usual non efficient gasoline vehicles in urban areas;</li> <li>- In rural areas and highways, CO<sub>2</sub> emission are respectively 0.09 kg/km and 0.26 kg/km respectively by PHEV and usual gasoline vehicles</li> </ul>
6.2. Low Carbon Credits	<ul style="list-style-type: none"> <li>- Carbon market is really recommended</li> </ul>

	<p>for such road transport option.</p> <ul style="list-style-type: none"> <li>- Once made available such a special incentive can result in a wide diffusion of PHEV in Rwanda</li> </ul>
<b>7. Financing Requirements and Costs</b>	
7.1. Private Sector Involvement	<ul style="list-style-type: none"> <li>- Once promoted and commercially available, the PHEV will greatly interest the private sector</li> </ul>
7.2. Capital Cost	<ul style="list-style-type: none"> <li>- The initial cost of a PHEV is higher than the conventional vehicles ;</li> <li>- In fact the PHEV, are still limited on international market</li> </ul>
7.3. Generating Costs	<ul style="list-style-type: none"> <li>- Cost of «gasoline-electric» fuel is 2 times lower than the cost of liquid fuel for classic gasoline vehicles;</li> <li>- The maintenance cost for classic gasoline vehicles is about 1.5 times more important than the PHEV maintenance</li> </ul>

---
